Explain one part. Point to where your code stores and changes the board or player turn. Add one AI request and a few sentences about what you checked or changed and the test result.

- `let G,ph,cur,horiz=true,hov=-1,msg='',msgHit=false,locked=false,nxt,win=0;`

Where the board can change:

- **Reset:** `init()` creates fresh `G`, sets `cur=0` and `ph='setup'`.
- **Placing ships:** the setup board's `bd.onclick` does `G[cur].ships.push({name:..., cells:a})`. Undo uses `G[cur].ships.pop()`, and `randomize(p)` rebuilds `G[p].ships`.
- **Firing:** `fire(i)` sets `me.shots[i]=hit?'h':'m'`, where `me` is `G[cur]`. It also sets `locked=true`.

Where the turn changes:

- **After setup:** the Done button (`$('dn').onclick`) switches from Player 1 to Player 2 (`cur=1`), and after Player 2 it sets `cur=0` and moves on to battle. Each time it sets `ph='cover'` and stores what should happen next in `nxt`.
- **During battle:** the End turn button does the actual swap:

AI PROMPT: Add explosion sound effects for when a ship is hit:

1. Placed ships.
2. Shot placement of other ship.
3. An explosion sound was made.
